

## 1. Installation

Install the CLI with cargo. Prebuilt binaries are also available on the releases page.

```
$ cargo install office2pdf-cli
$ office2pdf --version
office2pdf 0.6.0
```

## 2. Basic Usage

1. Convert a single file. The output PDF is written next to the input.

```
$ office2pdf report.docx
```

2. Convert with an explicit output path and paper size.

```
$ office2pdf slides.pptx -o out/slides.pdf --paper a4
```

3. Batch conversion of a directory.

```
$ office2pdf *.xlsx --outdir ./pdfs/
```

## 3. Troubleshooting

### 3.1 Fonts render differently from PowerPoint

Ensure the original fonts are installed, or pass `--font-path` pointing to a directory of TTF/OTF files. Missing fonts fall back to metric-compatible substitutes when available.

### 3.2 A sheet is cut off horizontally

Wide sheets are split by column groups. Set a print area in Excel or use `--paper legal --landscape` for more width.

## Appendix A. Exit Codes

| Code | Meaning                               |
|------|---------------------------------------|
| 0    | All files converted successfully      |
| 1    | At least one file failed to convert   |
| 2    | Invalid arguments or unreadable input |
